

Javier Gomez Mijangos

BSc Mathematics & Computer Science · Université Paris-Saclay

📍 France javier.gomezmiijan@gmail.com github.com/javpato in/javier-gomez

SKILLS

Building with AI

Fluent at building real software **with Claude** — directing it to design, write and review code to ship bigger projects, faster.

Programming

Python · C++ · JavaScript / TypeScript · SQL **intermediate** · Lean

Web & apps

Next.js · React · in-browser apps (WebAssembly)

AI, data & graphics

Flow matching & diffusion (generative models) · data science · ray tracing

EDUCATION

BSc — Double Degree, Mathematics & Computer Science

Université Paris-Saclay · France
Dual curriculum: algorithms & data structures, linear algebra, topology & differential calculus, formal proof (Lean), physics.

LANGUAGES

French — fluent

English — fluent

Spanish — fluent

Mandarin Chinese — conversational

Arabic — basic

HIGHLIGHTS

- Several shipped projects + a live portfolio site
- GitHub: Pull Shark ×2, Pair Extraordinaire ×2, YOLO
- Open to internships & collaborations

PROFILE

Maths and computer-science student who likes hard problems and **building things from scratch**. I ship real, polished projects — often by pairing with **AI (Claude)**, which I've learned to push hard to design, build and deliver well beyond typical solo-student scope. Applying to **Bending Spoons First Ascent** to work alongside exceptional people and contribute from day one.

SELECTED PROJECTS

Learning platform — “Formules Vivantes” github.com/javpato/learning-website • built with Claude

Next.js · TypeScript · React · WebAssembly

- An interactive site to learn maths, physics and CS — including a SQL course you practise on a **real database that runs entirely in the browser**.
- **Designed and built in partnership with Claude**, then moved onto a modern Next.js stack — learning to direct AI to ship a large, polished project on my own.

Flow-diffusion generative AI

in progress

Python · Flow matching · Diffusion models

- Studying **flow matching and diffusion**, and building generative models from what I learn.

Ray tracer

personal project · C++

Rendering · Computer graphics

- A from-scratch **3D renderer** — light, reflections and shadows — built to understand graphics from first principles.

Knife-Spoon-Mon — image classification

university project

Python · Data science

- Reached **97% accuracy** telling kitchen utensils apart, using a small hand-built dataset and a k-nearest-neighbours model.

EXPERIENCE

Startup shadowing — HUB71

Abu Dhabi

- Shadowed early-stage startup CEOs: product decisions, investor meetings, and scaling up close.
